

Privofy

Privacy decoded, risks revealed

01. Team Details

02. Problem Statement

When people sign up for a new online service (be it an app or a website), several people don't even bother to read the terms & conditions and privacy policy, nor do many people understand what it means.

This leads to companies exploiting people's data, as they have approved what the privacy policy says without people understanding it, resulting in data leaks, spam calls, and false claims.

This doesn't mean that people don't care about their data; in fact 60% of Indian Adults and 85% of Adults worldwide fear unauthorized data access and leaks, according to surveys. Whereas only 11% actually understand privacy policies (which contain how the company collects, handles, and protects users' data).

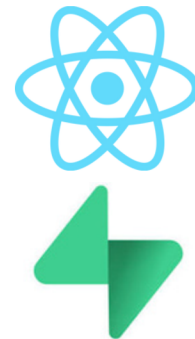

03. Solution

Aligned with SDG 16, the solution is a website where users can upload or search different companies' privacy policies. This policy is fed into an AI model which will analyse it and tell the user (in layman language) what the policy says, the legalities and concerns related to it, along with a safety score of it. This can be translated and listened to in the user's preferred language.

The site is hosted at <https://privofy.netlify.app>

04. Technology Stack

- a. React JS is used along with HTML and vanilla CSS for the website.
- b. User authentication and data storage are done on Supabase.
- c. Google's Gemini model is integrated to ensure that privacy policy insights are accurate and meaningful to the user.

Gemini

05. Implementation

When users log in to the site, they are allowed access to the Dashboard that contains the main features of the tool. The users are given the option to either search for a company's privacy policy in the site's large database or they may upload the privacy policy of their desired company for the required insights regarding the policy. Then the file is transferred to the system's backend where the A.I. model generates the required insights about the privacy policy (such as its summary, what does the company do to users data, and what are key takeaways for the user related to legal and data security) as well as calculates the safety score (like how much effort does the company put to make your data secure, transparency and related legal problems). These insights can further be translated and listened to in the user's preferred language.

Key features of the solution:

A simple-to-use and navigate website where users can upload the privacy policy of any company.

If they are unable to upload the privacy policy, they can search it in the site's large database of privacy policies and terms & conditions.

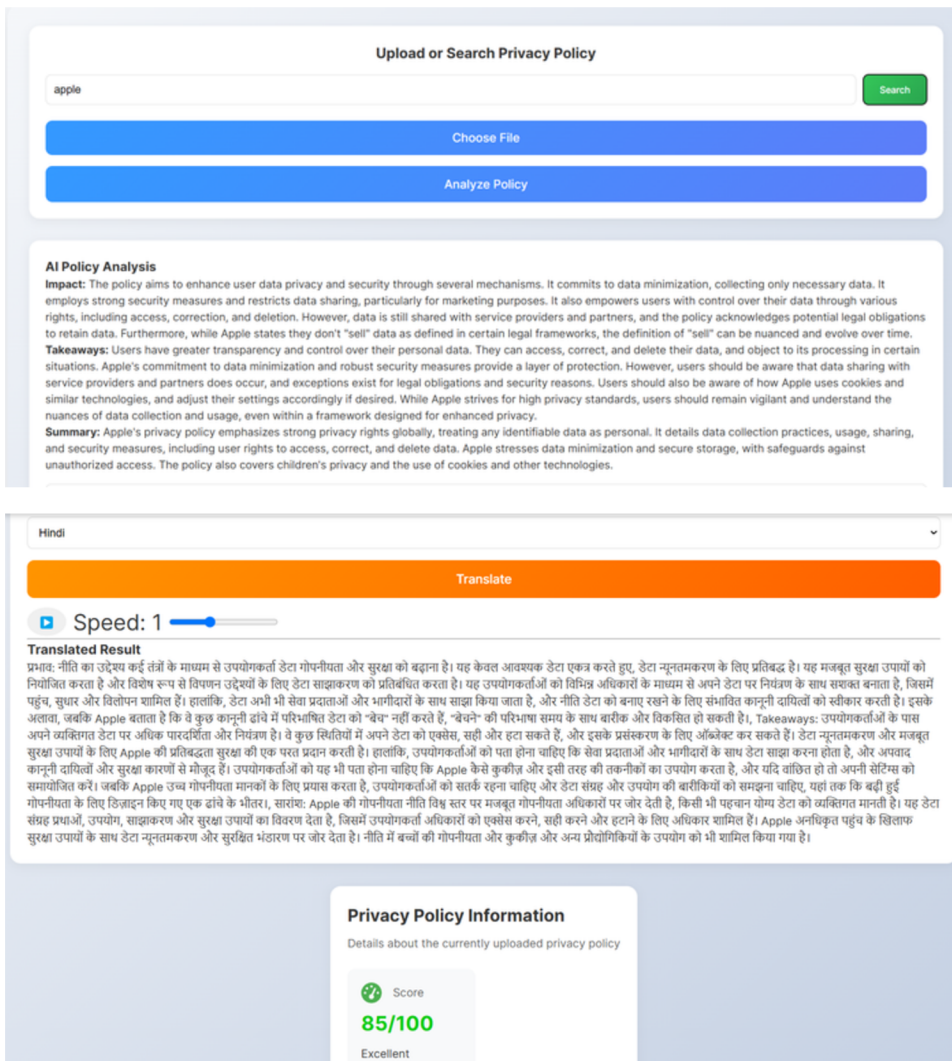

After the AI model analyzes the policy, it explains it to the person in layman's terms (to allow easy understanding of it), along with a safety score of the policy.

Users can also translate the text into their language of choice as well as hear the audio in their preferred language.

06. Impact and Scalability:

Everyone can benefit from the solution, irrespective of their educational background. As it would provide them a clear understanding of what the terms and agreement imply and its impacts before accepting them. This may also force companies to modify their privacy policy, thus reducing data leaks, chances of spam calls, etc.

This project can be easily scaled (as its a website) and hosted to a larger scale to make sure people have access to this tool worldwide.

07. Conclusion:

This project stands out as there is no related direct competition that has all the features we have. People who want to analyse and understand these complex privacy policies often have to hire lawyers to understand them, whereas we have automated the whole process. Users can comprehend the policy's terms and conditions using our solution as well as know the impacts and safety score.

This project deserves to win as it is solving a huge problem related to data security and privacy, data leaks, and spam calls that people actually want to be solved. Furthermore, this is aligned with SDG-16, on which the least work has been done till now.
